

**FORWARD KINEMATICS OF A '3-2-1' Type 6 S-P-S PARALLEL
MANIPULATOR USING SPHERE INTERSECTS WITH A
PROTOTYPE MODEL**

Robert Howell

BSc in Robotics

ABSTRACT

The forward solution of a six degree of freedom parallel manipulator is presented using sphere intersects that to the authors knowledge differs to the limited literature reported on the manipulator. The manipulator is a 6 SPS mechanism known as the 3-2-1 manipulator. Due to the property of having solvable forward kinematics the manipulator could be further studied or developed as a haptic device using the proposed method.

Modelling of the manipulator and the numerical algorithm to the forward kinematics is presented in this paper and a test mechanism is presented to test model.
